INVESTOR FAQ

Token Profitability & Stacking Income Model

SECTION 1 – TOKEN FUNDAMENTALS

1. What is the total token supply?

Total Supply: 1 Crore tokens

60% released during ICO

40% reserved & vested for ecosystem stability

Limited supply is designed to prevent uncontrolled inflation.

2. What were the pricing stages?

Pre-ICO → ₹10 (+8% bonus tokens)

ICO Round 1 → ₹20

ICO Round 2 → ₹30

ICO Round 3 → ₹40

Initial Listing → ₹50

This structured ladder ensures predictable capital formation.

3. Is token price guaranteed to increase?

No.

Price depends on:

- Market demand
- Ecosystem growth
- Liquidity management
- Token utility expansion

No guaranteed ROI is promised.

SECTION 2 – VESTING & APY STACKING

4. What is the vesting reward system?

Token holders may opt for vesting durations ranging from:

Duration	Indicative APY
8 weeks	20%
20 weeks	35%
40 weeks	50%
60 weeks	65%
80 weeks	80%

Rewards are distributed in tokens

This encourages long-term holding and reduces dump pressure.

5. How does stacking income work?

An investor can potentially benefit from:

1. Token price appreciation
2. Vesting APY rewards
3. Network commission income (if participating)
4. Salary qualification (if structure qualifies)
5. Profit share participation (leadership level)

This layered model is called income stacking.

6. Is APY guaranteed?

No.

APY applies only if:

- Tokens are locked
- Vesting terms are met
- Ecosystem rules remain active

It is not a fixed savings account.

SECTION 3 – NETWORK INCOME FOR INVESTORS

7. Can investors also build network income?

Yes.

If you refer members, you can earn up to 8 levels deep.

Commission structure:

Level	%
L1	15%
L2	10%
L3	8%
L4	5%
L5	3%
L6	2%
L7	1%
L8	1%

Total payout cap: 45%

8. Is this purely a recruitment model?

No.

The ecosystem transitions from:

Phase 1 – Token-driven expansion

Phase 2 – Product & service-backed revenue

Long-term sustainability depends on real business verticals.

SECTION 4 – BUY-BACK & LIQUIDITY

9. Is there a liquidity mechanism?

Yes.

The plan includes a structured buy-back mechanism to maintain liquidity confidence

However:

Buy-back supports liquidity, not guaranteed profit.

10. What protects token stability?

1. Limited total supply
 2. Vesting lock-ups
 3. Controlled release schedule
 4. Transition to utility usage in Phase 2
 5. Ecosystem revenue integration
-

SECTION 5 – RISK DISCLOSURE

11. What are the risks?

- Market volatility
- Token price fluctuation
- Recruitment slowdown
- Regulatory changes
- Ecosystem adoption risk

There is no risk-free investment model.

12. What happens if recruitment slows?

In Phase 1:

Token demand may reduce.

In Phase 2:

Product and service revenue becomes the income stabilizer.

This is why the two-phase model exists.

SECTION 6 – PROFIT EXPECTATION MANAGEMENT

13. What is realistic expectation?

Investors should evaluate:

- Tokenomics
- Vesting duration
- Network building capability
- Risk tolerance
- Long-term vision

Short-term speculation and long-term ecosystem building are different strategies.

14. Is this better suited for traders or builders?

Builders benefit from:

- Network stacking
- Salary qualification
- Profit participation

Passive traders rely mainly on price appreciation.

SECTION 7 – LONG-TERM TOKEN ROLE

After Phase 2, token evolves into:

- Utility token
- Governance access tool
- Loyalty reward mechanism
- Platform usage instrument

It becomes ecosystem fuel — not just speculative asset.

SECTION 8 – FINAL INVESTOR SUMMARY

Infinity 8 offers potential layered opportunity through:

- Structured token release
- Vesting incentives
- Network commission model

- Salary qualification system
- Transition to real revenue ecosystem

However:

- No guaranteed ROI
- No guaranteed price targets
- Income depends on participation and market conditions

Investors must assess risk tolerance carefully.
